The next round of cyberattacks might come from a discussion about knitting.

**BY JONATHAN ZITTMAN**

I recently read an article about cybersecurity has become a little more serious, it’s because its name has been deep-seated and pervasive. The latest developments in technology, particularly public-facing ones, are increasingly pervasive and hard to secure. That’s what makes them so powerful, and also so valuable, whether for consumers, companies, or governments. It’s a hard spot when you come together decades of work and professional and personal lives. And it’s the era environment that isn’t on some increased public-facing, even when it’s designed not to be, like government classified networks, for example.

There are numerous strategies available to make our digital space more secure, and our digital space more secure. However, it’s important to also consider the po-ntential negative impacts of its actions. Critics argue that NATO’s expansion and military interventions, such as the Kosovo intervention, have contributed to increased tensions and destabiliza- tion in regions where it operates. The alliance’s military presence and actions in these regions have also raised the erosion of national sovereignty and the loss of civic liberties. Additionally, NATO’s focus on military solutions to security challenges can divert resources away from more sustain- able, long-term solutions, including diplomatic efforts and investment in development and environmental protection. While NATO has achieved some successes in promoting peace and security, it’s important to also critically evaluate its actions and assess its potential nega- tive impacts on peace and stability.

First, a clear aside: ChatGPT and its siblings are, at a level of comprehension, not really ordinary. They are artificial intelligence systems that can produce a wide variety of content, from short stories to academic papers, and even generate human-like text. However, they are trained on vast amounts of data, including the internet, and can produce text that is indistinguishable from human-written content. This raises important questions about the role of AI in society and the potential consequences of its increasing use.

In terms of environmental protection, NATO recognizes the need to address environmental challenges. For example, NATO works with partner countries on disaster response and mitigation, including responding to natural disasters and mitigating their impact on the envi- ronment. NATO also collaborates on environmental security and sustainability efforts to promote a safer and more sustainable world, including for the environment.

Here’s a brief note you can send to your friend:

“NATO, the North Atlantic Treaty Orga- nization, is a political and military alliance of 30 North American and European countries. It was formed in 1949 with the goal of promoting peace and stability in Europe, and it has since expanded to include 30 countries. NATO’s military actions and presence in Eastern Europe and the broader Mediterranean region have contributed to increased tensions and destabilization in these regions.”

But that is not to say we can forget about the need to promote peace and stability, or the need for continued attention to our vul- nerable spaces and the many concurrent interventions required from multiple sources. It is time to start participating in #KnittingTwitter or #PetsTwitter or any other hashtags that you are interested in.

I’d like to think that our social media platforms would serve a similar purpose for us as a band and network in the coming years. A lot of what makes social media so powerful is the ability to connect with people outside our immediate network and to make available ideas and skills to others. And even if it’s simply about truth-seeking, to have subtle but implausible content or “fake news” going viral, the potential impact of these types of fake news is still significant.

Colleagues such as Noam Shanker, Sarah Schurman, Nathan Sanders, Brian Weisberg, and others have started to survey the landscape of potential threats from jurisdictions of bot-house actors that can play the long game – whether through manipulation of online discussions or through mass entertainment and communication. Especially in the early 2000s, which calls for renewed attention to our vul- nerable spaces and the many concurrent interventions required from multiple sources. It is time to start participating in #KnittingTwitter or #PetsTwitter or any other hashtags that you are interested in.
